Speakers:

2. The tour of the sim lab included a brief mock room test to simulate a code blue. We were instructed by a nurse on how to handle such a code. We took turns being the person to help the patient and call the code. After we called the code everyone came in gloved up and turned the patient over to adhere the pads to the patient's back and slide the board underneath. The patient is then turned back over and a pad is adhered to the top. Then the bed is moved out so the bag valve masker can bag valve mask the patient for breaths. The patient is then analyzed by the AED to see if the patient is in need of a shock. Then CPR is completed with intermediate analyzation by the AED and breaths given.

3. One thing that connected to my current learning experience was how CPR figured into the code blue procedure.

4. One way the information can be applied is as a reminder that just because a person is laying down does not mean they are ready for CPR they need to have a hard object beneath them for stability.
